Introduction

1. Technology has revolutionized healthcare by introducing tools that improve diagnosis, treatment, and patient management. Key developments include Electronic Health Records (different companies maintain their Databasesepar, National Health Authority MoHFW, GOI has launched its own app Named ABHA to store and maintain individual's health records) , Telemedicine, AI ML incorporation to enhance diagnosis and reduce medical errors
2. Improved Personal Care for patients, with all the the advancements people are able to monitor their own health(using of wearable device, reminder for medicines stockout and reminders for medicine etc) and access to different resources (like online/telephonic consultation, ordering of medicines, booking of home visits for pathological tests etc) [[Apple Watch saves 79-year-old Texas man's life](#), [Delhi Woman Thanks Tim Cook As Apple Watch Saves Her](#)]
3. Product Managers have a crucial role to play in this industry , identify gaps in the existing market and develop a holistic approach for the problem , ensure cross functional collaboration amongst different stakeholders, Health industry being highly regulated so it is the sole responsibility of product managers to ensure that their product are compliant with laws and regulation, It is also imperative for product managers to keep patient safety at heart of any solutions.

Size

1. According to the latest report by market intelligence platform Tracxn, total funding for Indian healthtech firms stood at \$9.9 billion as of July 2024, sharply higher than \$566 million in the US, and \$130 million in Singapore. [[Source](#)]
2. The Indian healthcare sector is growing rapidly and is projected to reach \$638 billion by 2025, according to a recent study by Bajaj Finserv AMC. [[Source](#)]
3. Healthcare innovation in India is currently a \$30 billion opportunity, dominated by pharma services and healthtech; biotech and medtech are nascent but witnessing green shoots and expected to reach \$60 billion by 2028. [[Source](#)]

Segments and Share

Health Care(Market Size \$370 Billion) Segment Distribution

HealthTech Segment Breakup

1. **Digital Health Systems** : This segment includes technologies such as Electronic Health Records (EHR), e-prescribing systems, and integrated digital health platforms that streamline patient care and operational efficiency. (Key players are Practo and MediBuddy)
2. **Tele-healthcare/medicine** : Telehealth services provide remote consultations and monitoring, making healthcare more accessible, especially in rural areas. (Key players being 1mg, Docplexus)
3. **mHealth (Mobile Health)** : This segment encompasses mobile applications and wearable devices that facilitate health tracking, remote monitoring, and disease management. (Players pioneering in this segment are FitBit, Apple Inc. and Wysa for emotional wellbeing)
4. **Health Analytics** : Refers to the systematic analysis(including clinical, financial, and operational analytics) of healthcare data to derive insights that can improve patient care, operational efficiency, and overall health outcomes, make informed decisions. (Innovaccer and ekinCare lead this segment)
5. **Health Information Technology (HIT)** : This segment includes software solutions for managing health information, ensuring interoperability, and enhancing data management across healthcare systems. (CureMetrix is a niche player operating in this area)
6. **Health Services** : This includes a range of services from telemedicine to home healthcare and wellness programs. (Almost all major hospital brands are building this ship but one player that is tech first by principle is Pristyn Care)
7. **Pharmaceuticals** : It includes drug discovery, prescription validation and delivery medicines to the last mile. Though this has now extended to products related to fitness and wellness as well(Multiple Players are operating in this segment like PharmEasy , Netmeds, ApolloPharmacy etc.)
8. **Biotechnology** : It utilizes biological systems, living organisms, or derivatives to develop products and technologies that benefit society. This multidisciplinary area integrates knowledge from biology, chemistry, engineering, and other sciences to address challenges in healthcare, agriculture, and environmental sustainability. (Active Players are Biocon Ltd., Bharat Serums and Vaccines Limited)

Technologies in HealthTech

The HealthTech industry in India leverages a variety of technologies to develop innovative solutions aimed at improving healthcare delivery, patient outcomes, and operational efficiency.

1. **Artificial Intelligence (AI)** : AI is used for predictive analytics, diagnostics, and personalized medicine. In India, AI algorithms analyze patient data to identify disease patterns and suggest treatment options, enhancing decision-making in healthcare settings.
2. **Machine Learning (ML)** : ML models are employed to improve diagnostic accuracy and automate administrative tasks. For instance, Indian startups use ML for developing algorithms that assist in early detection of diseases like diabetes and cancer.
3. **Internet of Medical Things (IoMT)** : IoMT devices enable remote patient monitoring through wearables that track vital signs. In India, IoT is used in chronic disease management, allowing healthcare providers to monitor patients' health data in real-time.
4. **Blockchain** : Blockchain technology ensures secure and transparent sharing of medical records among stakeholders. In India, it is being explored for maintaining the integrity of health data and enhancing patient privacy.
5. **Cloud Computing** : Cloud platforms facilitate the storage and sharing of health data across various healthcare providers. This technology supports telemedicine services and EHR systems in India by providing scalable infrastructure.
6. **Big Data Analytics** : Big data analytics processes large volumes of health data to derive insights for population health management. Indian healthcare organizations use it to analyze trends and improve public health strategies.
7. **Augmented Reality (AR) and Virtual Reality (VR)** : AR/VR technologies are used for medical training and patient education by simulating real-life scenarios. In India, these technologies help train medical professionals through immersive experiences.
8. **Cybersecurity Solutions** : Cybersecurity technologies protect sensitive health information from breaches and unauthorized access. Given the rise of digital health solutions in India, robust cybersecurity measures are essential for maintaining patient trust.
9. **Natural Language Processing (NLP)** : NLP is used to process and analyze unstructured medical data from clinical notes and patient interactions. Indian startups leverage NLP for enhancing EHR systems by extracting relevant information efficiently.
10. **Robotics** : Robotics technology is applied in surgical procedures to enhance precision and reduce recovery time. In India, robotic surgery is gaining traction in hospitals for complex surgeries like orthopedic and cardiac procedures.

Government Initiatives/Support

The Indian government has implemented various policies and initiatives specifically aimed at supporting the HealthTech industry. These initiatives focus on fostering innovation, enhancing infrastructure, and encouraging investment in health technology solutions. Here are some key policies and support mechanisms:

1. **Production-Linked Incentive (PLI) Scheme** : The PLI scheme encourages domestic manufacturing of pharmaceuticals and medical devices by providing financial incentives to companies that meet specified production targets. This initiative aims to boost local manufacturing capabilities, reduce dependency on imports, and enhance the competitiveness of Indian HealthTech firms.
2. **National Digital Health Mission (NDHM)** : NDHM aims to develop an integrated digital health ecosystem by creating a digital health ID for citizens, facilitating the secure exchange of health information across platforms. This initiative promotes interoperability among health systems, improving access to healthcare services and enhancing data-driven decision-making.
3. **Ayushman Bharat Digital Mission (ABDM)** : ABDM aims to create a comprehensive digital health infrastructure that supports health data exchange and enhances service delivery. By promoting digital solutions in healthcare, ABDM facilitates the growth of HealthTech companies focused on telemedicine, EHRs, and other digital health services.
4. **National Health Policy (NHP) 2017** : The NHP emphasizes strengthening health systems through improved healthcare delivery mechanisms, including the use of technology. It provides a framework for integrating technology into healthcare services, promoting research and innovation in health technologies.
5. **Tax Incentives for Healthcare Providers** : The government offers tax benefits such as deductions for investments in technology used in healthcare services like telemedicine. These incentives encourage HealthTech companies to invest in innovative technologies that improve service delivery.
6. **National Health Systems Resource Centre (NHSRC)** : Provides technical support to state governments for implementing health programs effectively. NHSRC aids in integrating technology into public health systems, enhancing overall healthcare delivery.
7. **Telemedicine Practice Guidelines** : Issued by the Ministry of Health and Family Welfare (MoHFW), these guidelines provide a regulatory framework for practicing telemedicine. They facilitate the legal use of telehealth services, encouraging HealthTech companies to develop telemedicine platforms.
8. **Healthcare Innovation Challenge** : The government periodically launches challenges to encourage startups and innovators to develop solutions addressing specific healthcare problems. This fosters innovation in HealthTech by providing a platform for new ideas and solutions.
